

Josamycin

Catalog No: tcsc0013975

Available Sizes			
Size: 25mg			
Size: 100mg			
Specifications			
CAS No: 16846-24-5			
Formula: C ₄₂ H ₆₉ NO ₁₅			
Pathway: Anti-infection			
Target: Bacterial			
Purity / Grade: >98%			
Solubility: 10 mM in DMSO			
Alternative Names: EN-141			
Observed Molecular Weig	h+:		

Product Description

827.99

Josamycin (EN-141) is a macrolide antibiotic exhibiting antimicrobial activity against a wide spectrum of pathogens, such as **bacteria** . The dissociation constant $\mathbf{K_d}$ from ribosome for Josamycin is 5.5 nM.

IC50 & Target: Kd: 5.5 nM (ribosome)^[1]

In Vitro: Studies show that the average lifetime on the ribosome is 3 h for Josamycin and that the dissociation constants for Josamycin binding to the ribosome is 5.5 nM. Josamycin slows down formation of the first peptide bond of a nascent peptide in an amino acid-dependent way and completely inhibits formation of the second or third peptide bond, depending on peptide sequence at a saturating drug concentration, synthesis of fulllength proteins is completely shut down by Josamycin. At a saturating drug concentration, synthesis of fulllength proteins is completely shut down by Josamycin^[1].

In Vivo: Blood and tissue levels of Josamycin after oral administration are 200 mg/kg to rabbits. Tissue levels are generally much higher than the blood levels, and 3 h after the administration, when the blood level is very low, the tissue levels are rather higher than those 1 h after the dose. One hour after the medication, the level in the lungs is the highest of all the tissue levels^[2].
