<b>Solub</b> DMSO	oility: : 50 mg/mL (143.89 mM; Need ultrasonic)
	native Names: iraterone;CB-7627;Abiraterone D4A metabolite
Obse	rved Molecular Weight:

## **Product Description**

347.49

D4-abiraterone is a major metabolite of abiraterone. D4-abiraterone is an inhibitor of **CYP17A1**, 3b-hydroxysteroid dehydrogenase (**3βHSD**) and steroid-5a-reductase (**SRD5A**) and also an antagonist of **androgen receptor**.

IC50 & Target: CYP17A1, 3βHSD, SRD5A, androgen receptor<sup>[1]</sup>

In Vitro: D4-abiraterone (D4A ) (10 mM) nearly completely blocks conversion from D4-androstenedione (AD) to  $5\alpha$ -androstanedione and other  $5\alpha$ -reduced androgens. The affinity of D4-abiraterone for mutant (expressed in LNCaP, half-maximum inhibitory concentration (IC $_{50}$ =5.3 nM)) and wild type (expressed in LAPC4, IC $_{50}$ =7.9 nM) androgen receptor (AR) is greater than that of abiraterone (Abi) (IC $_{50}$ =418 and >500 nM, respectively). Compare with Abi, D4-abiraterone clearly better suppresses PSA, TMPRSS2 and FKBP5 expression in LNCAP, LAPC4 and C4-2 cell lines. D4-abiraterone also inhibits AR target gene expression in a dosedependent manner<sup>[1]</sup>.

In Vivo: D4-abiraterone (D4A) is tenfold more potent than abiraterone (Abi) in blocking conversion from dehydroepiandrosterone (DHEA) by 3 $\beta$ -hydroxysteroid dehydrogenase (3 $\beta$ HSD) to D4-androstenedione (AD) in LNCaP and VCaP xenografts. 0.1  $\mu$ M D4-abiraterone is equivalent to 1  $\mu$ M Abi for blocking AD accumulation at 48 h in both LNCaP and VCaP xenografts. Progression is significantly delayed in the D4-abiraterone group compare with the Abi acetate group (P=0.011). D4-abiraterone treatment increases progression-free survival compare with Abi acetate<sup>[1]</sup>.
