

Doxercalciferol

Catalog No: tcsc0395

Available Sizes

Size: 2mg

Size: 5mg

Size: 10mg

Size: 25mg

Size: 50mg

Size: 100mg

Specifications

CAS No:

54573-75-0

Formula:

$C_{28}H_{44}O_2$

Pathway:

Vitamin D Related

Target:

VD/VDR

Purity / Grade:

>98%

Solubility:

10 mM in DMSO

Alternative Names:

1.alpha.-Hydroxyvitamin D2

Observed Molecular Weight:

412.65

Product Description

Doxercalciferol is a Vitamin D2 analog, acts as an activator of **Vitamin D receptor**, and prevent renal disease.

IC50 & Target: Vitamin D receptor^[1]

In Vivo: Doxercalciferol (0.083, 0.167 or 0.333 $\mu\text{g}/\text{kg}$, i.p.) elevates serum phosphorus at Week 6 in 5/6 nephrectomized (NX) rats. Doxercalciferol (0.167 and 0.333 $\mu\text{g}/\text{kg}$) also increases serum calcium and Ca \times P at Weeks 2 and 6, and enhances increased pulse wave velocity (PWV) at Week 6 in 5/6 nephrectomized (NX) rats. Doxercalciferol blocks PTH from rising at 0.083 $\mu\text{g}/\text{kg}$, and lowers serum PTH to the SHAM level^[1]. Doxercalciferol (125 ng/kg, i.p. thrice per week) increases expression of VDR mRNA level and renal expression of TRPV5 in NON mice fed a HF diet. Doxercalciferol also improves proteinuria, prevents loss of podocytes, and accumulation of extracellular matrix proteins in HF diet-induced mice. Doxercalciferol inhibits the expression of profibrotic growth factors (TGF- β , PAI-1, and connective tissue growth factor (CTGF)), and blocks increased expression of the renin-angiotensin-aldosterone system in mice fed a HF diet. Furthermore, Doxercalciferol suppresses macrophage infiltration, decreases NF- κb activity, and prevents expression of proinflammatory cytokine and the increase in renal lipid accumulation in mice fed a HF diet^[2]. Doxercalciferol (30 ng/kg, i.p. thrice per week) prevents albuminuria, markedly attenuates podocyte loss and apoptosis, and reduces glomerular fibrosis in streptozotocin-induced diabetic mice^[3].
