

Napabucasin

Catalog No: tcsc1747

Available Sizes

Size: 5mg

Size: 10mg

Size: 50mg

Size: 100mg

Size: 200mg

Size: 500mg

Size: 1g

Specifications

CAS No:

83280-65-3

Formula:

$C_{14}H_8O_4$

Pathway:

JAK/STAT Signaling;Stem Cell/Wnt

Target:

STAT;STAT

Purity / Grade:

>98%

Solubility:

DMSO : 7.14 mg/mL (29.72 mM; Need ultrasonic and warming)

Observed Molecular Weight:

240.21

Product Description

Napabucasin is a newly found small molecule with the ability to inhibit gene transcription of **STAT3**, which is able to suppress cancer stemness properties and induce cell death.

IC50 & Target: STAT3^[1]

In Vitro: Napabucasin inhibits the expressions of stemness markers and kill stemness-high cancer cells isolated from several kinds of tumors except PCa. Napabucasin not only inhibits cell proliferation, cell motility, cell survival, colony formation ability, and tumorigenic potential of PCa cells, and increases cell apoptosis and sensitivity to docetaxel, but also effectively blocks sphere formation of PrCSCs and kill them as well as inhibits stemness gene expression. Napabucasin inhibits cell proliferation in PC-3 cells and 22RV1 cells at 48, 72, 96, and 120 h (P[1]).

In Vivo: Napabucasin (40 mg/kg) or Docetaxel significantly reduces xenograft tumor growth and tumor volume (TV) compared with PBS (P[1]).
