

Eflornithine (hydrochloride)

Catalog No: tcsc2984

Available Sizes

Size: 10mg

Size: 50mg

Specifications

CAS No:

68278-23-9

Formula:

$C_6H_{13}ClF_2N_2O_2$

Pathway:

Others

Target:

Others

Purity / Grade:

>98%

Solubility:

10 mM in H₂O

Alternative Names:

DFMO hydrochloride;MDL71782 hydrochloride;RMI71782 hydrochloride; α -difluoromethylornithine hydrochloride

Observed Molecular Weight:

218.63

Product Description

Eflornithine hydrochloride is a specific, irreversible inhibitor of the enzyme **ornithine decarboxylase**. Eflornithine is a medication for the treatment of African trypanosomiasis and excessive facial hair growth in women.

In Vivo: Eflornithine is the only new molecule registered for the treatment of human African trypanosomiasis over the last 50 years. It is the drug used mainly as a back-up for melarsoprol refractory *Trypanosoma brucei gambiense* cases^[1]. In subjects with excessive, unwanted facial hair, eflornithine 15% cream is superior to placebo in reducing hair growth. After 24 weeks' treatment, 58% of eflornithine and 34% of placebo subjects have at least some improvement in facial hirsutism^[2]. The hair growth inhibitory activity of eflornithine is significantly enhanced when the eflornithine cream is applied onto a mouse skin area pretreated with microneedles^[3]. Treatment of coarctation hypertensive rats with eflornithine results in a normalization of the contractile intensity to KCl and norepinephrine and relaxations to acetylcholine by 14 days of hypertension^[4].
