## **Test Principle**

The test principle applied in this kit is Sandwich enzyme immunoassay. The microtiter plate provided in this kit has been pre-coated with an antibody specific to Basic Salivary Proline Rich Protein 1 (PRB1). Standards or samples are then added to the appropriate microtiter plate wells with a biotin-conjugated antibody specific to Basic Salivary Proline Rich Protein 1 (PRB1). Next, Avidin conjugated to Horseradish Peroxidase (HRP) is added to each microplate well and incubated. After TMB substrate solution is added, only those wells that contain Basic Salivary Proline Rich Protein 1 (PRB1), biotin-conjugated antibody and enzyme-conjugated Avidin will exhibit a change in color. The enzyme-substrate reaction is terminated by the addition of sulphuric acid solution and the color change is measured spectrophotometrically at a wavelength of 450nm  $\pm$  10nm. The concentration of Basic Salivary Proline Rich Protein 1 (PRB1) in the samples is then determined by comparing the O.D. of the samples to the standard curve.
