

Ca Ski

Catalog No: tcel48

Available Sizes

Size: 1×10⁶cells/t25culturebottle

Specifications

Subculturing:

Remove and discard culture medium. Briefly rinse the cell layer with DPBS solution to remove all traces of serum that contains trypsin inhibitor. Add 1.0 to 2.0 mL of Trypsin-EDTA solution to flask and observe cells under an inverted microscope until cell layer is dispersed (usually within 2 to 3 minutes). Cells that are difficult to detach may be placed at 37°C to facilitate dispersal. Add 4.0 to 6.0 mL of complete growth medium and aspirate cells by gently pipetting. Add appropriate aliquots of the cell suspension to new culture vessels.

Product Description

The cells are reported to contain an integrated human papillomavirus type 16 genome(HPV-16, about 600 copies per cell) as well as sequences related to HPV-18. ATCC has confirmed this cell line is positive for the presence of human papilloma virus(HPV) viral sequences via PCR.
