

ME-180

Catalog No: tcel155

Available Sizes

Size: 1×10⁶cells/t25culturebottle

Specifications

Subculturing:

Remove and discard culture medium. Briefly rinse the cell layer with DPBS solution to remove all traces of serum that contains trypsin inhibitor. Add 1.0 to 2.0 mL of Trypsin-EDTA solution to flask and observe cells under an inverted microscope until cell layer is dispersed (usually within 2 to 3 minutes). Cells that are difficult to detach may be placed at 37°C to facilitate dispersal. Add 4.0 to 6.0 mL of complete growth medium and aspirate cells by gently pipetting. Add appropriate aliquots of the cell suspension to new culture vessels.

Product Description

Desmosomal attachments were observed between cells in monolayer culture and cytoplasmic tonofilaments were noted. Contamination with Mycoplasma arginini was detected and eliminated in 1970. Growth of ME-180 cells is inhibited by tumor necrosis factor alpha(TNF alpha). The cells contain human papillomavirus(HPV) DNA with greater homology to HPV-39 than HPV-18.
