

## ME-180

Catalog No: tcel155

### Available Sizes

**Size:** 1×10<sup>6</sup>cells/t25culturebottle

### Specifications

#### Subculturing:

Remove and discard culture medium. Briefly rinse the cell layer with DPBS solution to remove all traces of serum that contains trypsin inhibitor. Add 1.0 to 2.0 mL of Trypsin-EDTA solution to flask and observe cells under an inverted microscope until cell layer is dispersed (usually within 2 to 3 minutes). Cells that are difficult to detach may be placed at 37°C to facilitate dispersal. Add 4.0 to 6.0 mL of complete growth medium and aspirate cells by gently pipetting. Add appropriate aliquots of the cell suspension to new culture vessels.

### Product Description

Desmosomal attachments were observed between cells in monolayer culture and cytoplasmic tonofilaments were noted. Contamination with Mycoplasma arginini was detected and eliminated in 1970. Growth of ME-180 cells is inhibited by tumor necrosis factor alpha(TNF alpha). The cells contain human papillomavirus(HPV) DNA with greater homology to HPV-39 than HPV-18.
